## IN THE UNITED STATES PATENT AND TRADEMARK OFFICE

Applicants: Donald Christopher et al.

Art Unit: 3737

Serial No.: to be assigned

Examiner: William C. Jung

Filed : herewith

For : AUTOMATIC OPTIMIZATION OF

DOPPLER DISPLAY PARAMETERS

I hereby certify that this correspondence is being deposited with the United States Postal Service as first class mail in an envelope addressed to:

**Commissioner of Patents and Trademarks** 

Washington, D.C. 20231

on Oct. 27 2603
(Date of Deposit)

W. Brinton Yorks, Jr.

Name of applicant, assignee, or Registered Representative

W. Butan Yelly
(Signature)

(Date of Signature)

Hon. Commissioner of Patents and Trademarks

Washington, D.C. 20231

## VOLUNTARY AMENDMENT

Dear Sir:

Please amend the specification of the enclosed continuation application as follows.

## On page 1, lines 4-6 immediately following the title, please insert

This application is a continuation of application serial number 09/941,348, filed August 28, 2001.

## Amend the paragraph beginning on page 9, line 5 as follows:

Colorflow data may also be used to automatically adjust the parameters of a corresponding spectral Doppler display as shown in FIGURES 7 and 8. FIGURE 7 shows a colorflow Doppler image 40 which is used to image the blood flow velocities of the portion of a vessel 50 which is inside a color box 42. A spectral analysis such as that of FIGURE 2 is initiated by positioning a sample volume 52 over the center of the blood vessel 50. A flow direction cursor 54 is set to be aligned with the direction of blood flow for angle correction. Preferably the flow direction cursor setting and angle correction is performed automatically as described in U.S. Patent 6,464,637 application serial number 09/721,301, filed 11/21/2000. Next to the colorflow image 40 on the display screen is a color bar 60, which depicts the mapping of the flow colors to a range of velocity values. In this illustration positive velocities extend from green (G) to yellow (Y) in color and negative velocities extend from light blue (LB) to dark blue (DB), where the zero velocity point between green and yellow is the color baseline.
